

Create comprehensive clinical documentation using your voice.

A mobile application with robust functionality that maximizes clinician productivity.

High quality patient care is the goal of every healthcare facility. And medical documentation is at the heart of it all. It has to be thorough, accurate and timely. In the ambulatory environment, increased patient loads, EHR limitations and regulatory requirements compound the demands of the physician and negatively impact documentation. How can physicians complete documentation quickly while medical facilities meet operational goals that enhance patient care?

Speech. It's the fastest way to communicate. So why not leverage the power of voice when creating documentation? Even better, use a mobile application, and you have efficiency and convenience combined in one easy-to-use documentation solution. Dictation created with a powerful mobile application integrates seamlessly into a clinician's existing process and workflow. Physicians can record detailed narrative information and create comprehensive patient records from any location at any time, whether it's between appointments or after hours.

Clinic 360 Mobile allows medical providers with iOS or Android devices to manage their documentation from anywhere using a Wi-Fi network or cellular data connection. Clinicians using Clinic 360 Mobile save time, increase report accuracy and improve document turnaround times. Furthermore, online app store and market installation minimizes demand on IT resources.

Easy documentation creation.

Clinicians can leverage the touch-based interfaces of smartphones and tablets to efficiently create dictations. Clinicians select from a list of common work types, identify patients, control recording and upload completed dictations with a touch of a finger. The intuitive interface requires minimal clinician training.

Authorized users are presented with an up-to-date appointment schedule that serves as a convenient work list and tracks their daily documentation. Tapping on an appointment initiates the dictation process and automatically associates key patient data with the dictation.

A library of document and dictation templates prompts necessary data and speeds documentation while patient demographics and historical documentation can be reviewed while dictating. Unlike dedicated mobile dictation devices that require docking stations and introduce upload delays, the voice file is automatically and securely transferred for transcription at completion.

Customized settings to optimize workflow.

Individual users can customize application settings to mirror their current workflow and provide easy access to the most-used features. Clinicians can view preferred document templates and create an unlimited number of dictation templates that guide content and only require dictating exceptions.

Safe, secure distribution.

Transcribed content is easily reviewed, edited, signed and integrated into the electronic health record (EHR). With over 1,600 interfaces for hundreds of different EHRs, transcription content can automatically be placed in a specified format and location as a narrative report or structured document. Documentation can also be automatically forwarded to referring physicians or routed for auto-faxing or printing.

Clinic 360 Mobile is a safe, secure and HIPAA-compliant application that complements EHR use by simplifying the documentation task and supporting thorough, high quality documentation that powers physician productivity and improved patient care.

To learn more about how Nuance can help you improve financial performance, raise the quality of care, and increase clinician satisfaction, please contact us at 1-877-805-5902 or visit nuance.com/healthcare.

Key features

- Designed for the ambulatory environment.
- Real-time schedule serves as the daily work list.
- System-generated templates streamline document creation.
- Historical patient information can be reviewed while dictating.
- Simplified edit and approval process decreases turnaround times.
- Authentication automatically triggers distribution to print, fax or populate the EHR.

Key benefits

- Increases clinician convenience and satisfaction.
 - Enhances clinician productivity.
 - Improves documentation turnaround time and accuracy.
 - Bolsters high-quality dictation capture.
 - Reduces documentation-related costs.
 - Enables comprehensive documentation.
 - Supports EHR adoption with sophisticated integration.
